

- *New to the slow-fly indoor model scene* -

Indoor Electric Helicopter

Hoverfly - A novel concept in rotary wing technology

The **Hoverfly** is an easy to fly miniature helicopter that flies right out of the box.

The ingenious patented **Electrocyclic** control provides the full cyclic, yaw and collective functions of the larger 30 and 60 size outdoor models.

Hovering, nose-in flying, circuits etc, can all be accomplished in the smallest of domestic spaces by the competent heli flier. Even the experts find it fun, but the extreme mechanical simplicity and ruggedness make the **Hoverfly** ideal for the beginner.

Further aid for the trainee with access to a personal computer is available in the form of dedicated flight simulator software. It was never easier for the beginner or for those making the upgrade from fixed wing to prepare themselves in their own home for the joys of helicopter flying, independent of weather, daylight and flying site.

- **Small size** - perfect for indoor flight.
- **Realistic flying parameters** - eases transition to larger outdoor models.
- **Precision tail control** - with a sub-miniature yaw rate demand gyroscope (available as an option).
- **Unlimited flight duration** - without batteries, via a mains power unit and a thin, unobtrusive tether.
- **Simple and robust mechanics** The brains are in the **Electrocyclic** collective-cyclic control and the electronic rate gyro.
- **Easy and economic repairs** All parts available from the UK manufacturer.
- **Flight simulator** (option) for PC, from the top UK development team - *in preparation*.
- **R/C transmitter-friendly** Operates from standard TXs with minimum of four channels.
- **Ready to fly** - with 240v power unit, system controller, training undercarriage, decal kit, connecting leads and instructions.
